

Soils: The mothers of forests  
Forests: The mothers of soils

Soil formation

Parent Material → The Rock that is weathering  
to form soil.

Weathering → Is the biochemical process that  
involves destruction and synthesis.

→ Rocks are broken down into smaller  
and smaller fragments based on their  
constituent materials (Mineral)

Chemical decomposition

→ Minerals are altered or decomposed through chemical reactions and solvents are synthesized

Physical Disintegration

→ Rocks breaking into smaller pieces through mechanical action (water, wind, expansion, roots/biology)

Rock texture	Light-colored mineral (e.g., feldspars, muscovite)		Dark-colored minerals (e.g., hornblende, augite, biotite)	
	Quartz			
Coarse	Granite	Diorite	Gabbro	Peridotite Hornblendite
Intermediate	Rhyolite	Andesit	Basalt	
Fine	Felsite/Obsidian			

Rock texture determines

1) How quickly material weathers

2) Influence

Soil particle size

Dominant Mineral	Type of Rock	
	Sedimentary	Metamorphic
Calcite ( $\text{CaCO}_3$ )	Limestone	Marble
Dolomite ( $\text{CaCO}_3 \cdot \text{MgCO}_3$ )	Dolomite	Marble
Quartz ( $\text{SiO}_2$ )	Sandstone	Quartzite
Clays	Shale	Slate
Variable, silicates	Conglomerate <sup>a</sup>	Gneiss <sup>b</sup>
Variable, silicates		Schist <sup>b</sup>

<sup>a</sup>Small stones of various mineralogical makeup are cemented into conglomerate.

<sup>b</sup>The minerals present are determined by the original rock, which has been changed by metamorphism. Primary minerals present in the igneous rocks commonly dominate these rocks, although some secondary minerals are also present.

Mineral found  
in rocks

Mineral synthesized  
through chemical weathering

Primary Minerals

Secondary Minerals

Primary Minerals		Secondary Minerals		
		Goethite	$\text{FeOOH}$	Most resistant   Least resistant
		Hematite	$\text{Fe}_2\text{O}_3$	
		Gibbsite	$\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$	
Quartz	$\text{SiO}_2$	Clay minerals	Al silicates	
Muscovite	$\text{KAl}_3\text{Si}_3\text{O}_{10}(\text{OH})_2$			
Microcline	$\text{KAlSi}_3\text{O}_8$			
Orthoclase	$\text{KAlSi}_3\text{O}_8$			
Biotite	$\text{KAl}(\text{Mg},\text{Fe})_3\text{Si}_3\text{O}_{10}(\text{OH})_2$			
Albite	$\text{NaAlSi}_3\text{O}_8$			
Hornblende <sup>a</sup>	$\text{Ca}_2\text{Al}_2\text{Mg}_2\text{Fe}_3\text{Si}_6\text{O}_{22}(\text{OH})_2$			
Augite <sup>a</sup>	$\text{Ca}_2(\text{Al},\text{Fe})_4(\text{Mg},\text{Fe})_4\text{Si}_6\text{O}_{24}$			
Anorthite	$\text{CaAl}_2\text{Si}_2\text{O}_8$			
Olivine	$\text{Mg},\text{FeSiO}_4$			
		Dolomite <sup>b</sup>	$\text{CaCO}_3 \cdot \text{MgCO}_3$	
		Calcite <sup>b</sup>	$\text{CaCO}_3$	
		Gypsum	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$	

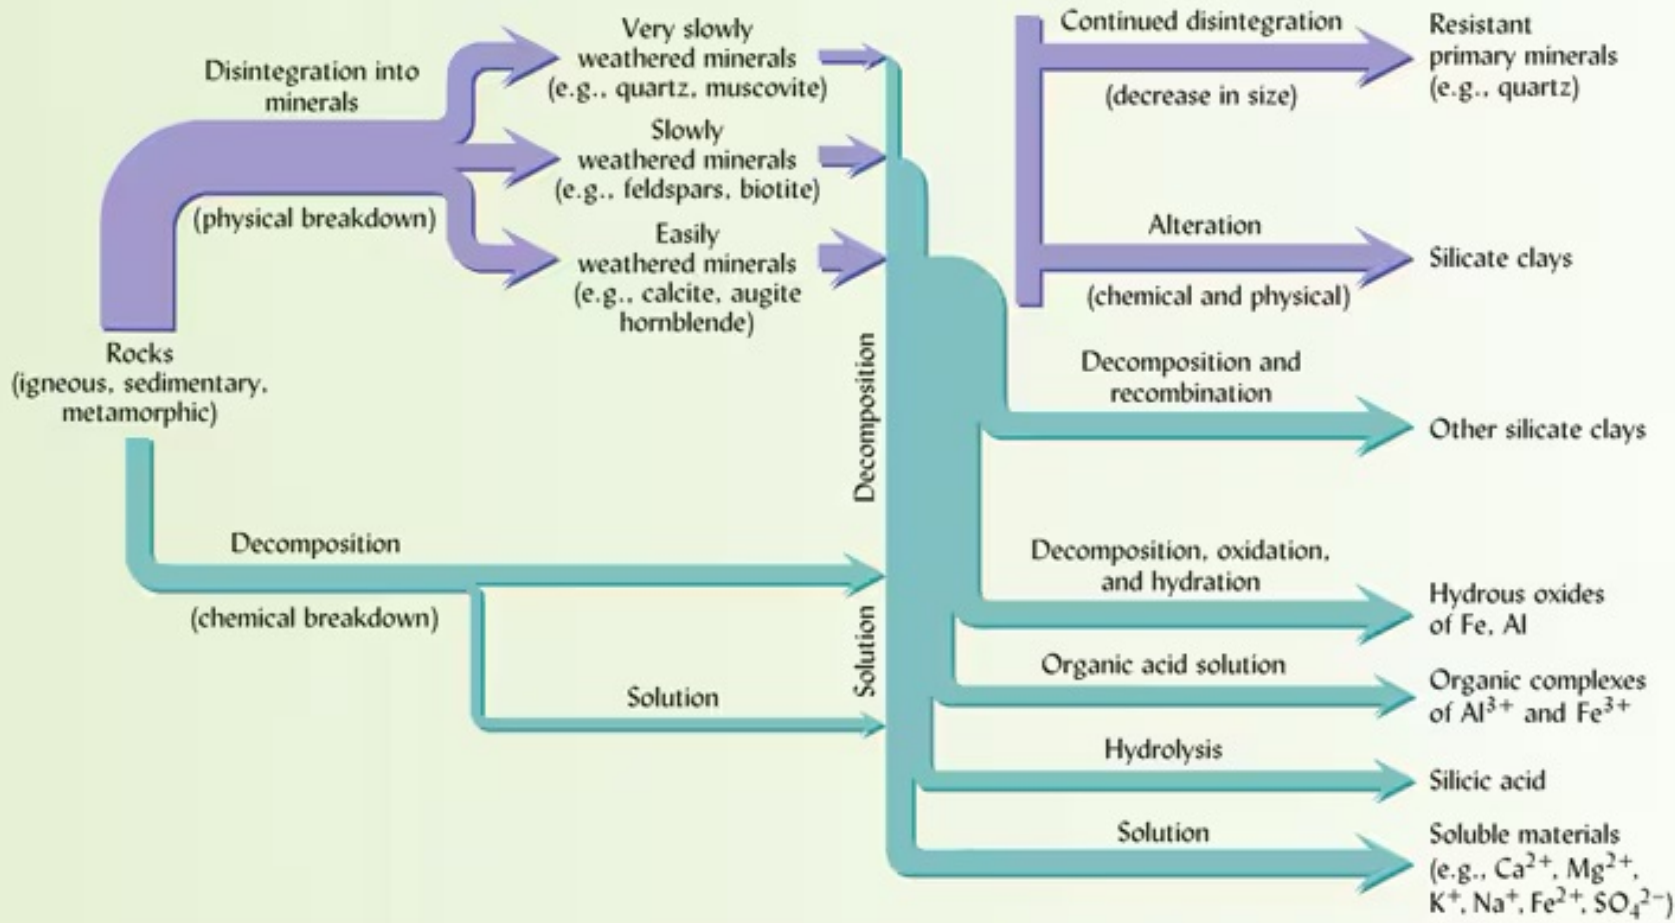

<sup>a</sup>The given formula is only approximate since the mineral is so variable in composition.

<sup>b</sup>In semiarid grasslands, dolomite and calcite are more resistant to weathering than suggested because of low rates of acid weathering.

## Physical weathering

- Temperature; differential heating and cooling of minerals → Exfoliation
- Wind, Ice, Water → freeze; thaw → Round rocks
- Biological processes in physical deformation

Exfoliation

Physical  
Weathering

↳ Water and  
wind

Wind +  
Water

Wind

Water

Biological

---

Chemical Weathering! Always happens  
faster in the presence of water

→ Hydration

In fact water binds to

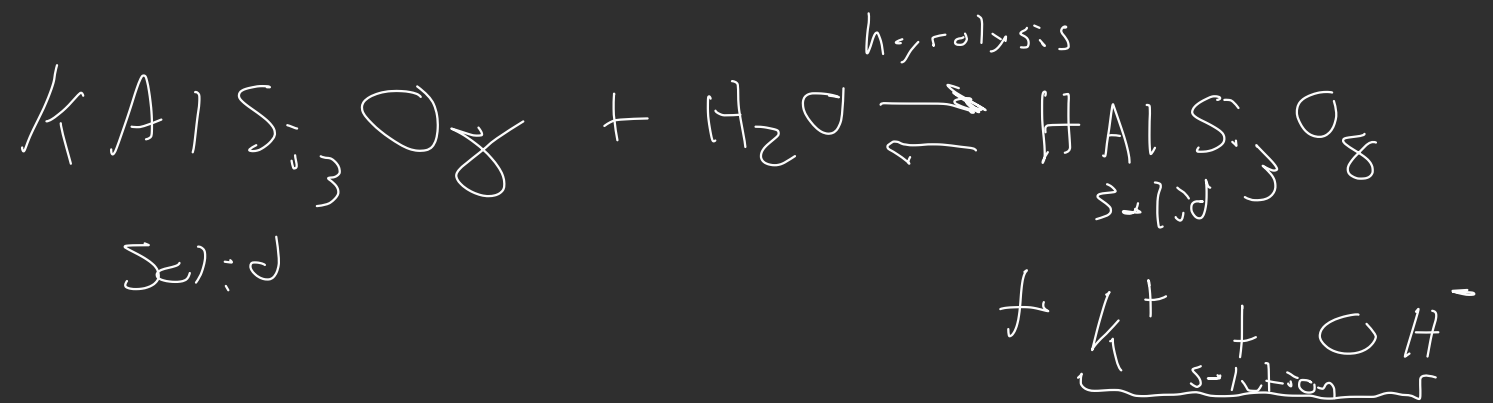

Hydrolysis  $\rightarrow$  Sol:!

- Water splits into hydrogen and hydroxyl groups and hydrogen replaces a cation

$\swarrow$  Microclimate that contains K feldspar
